# Wallmob Backoffice Release Notes

---

**Version 2.20.1.0**

## Written by

Bjørn Willoch Bjanger, Product owner

## Contents in release

### **2.20.1.0**

These are the major changes in the backoffice version 2.20.1.0

You can now log in to backoffice, POS and the SmartStore app and also authenticate against the API with your own user within the master user context.

We have added integration to deliver orders as json files to an sftp server.

We have added integration to deliver orders to SmartStore. SmartStore can push data to Wallmob about shops, users, products and prices , Wallmob delivers sales back for financial reporting.

With the introduction of preorders and shared bills, only paid and closed orders are reported to eAccounting and other external systems.

We now introduce age restriction on categories and products, where products will inherit restrictions set on their category, but can override this restriction for each product. When sold in POS, an age restricted item will require that the cashier checks the birth date of the customer.

We have added more information into the transactions csv report, and have now removed the question to reuse existing reports that has annoyed quite a few people.

To the benefit of integrators using the Wallmob API, we have now also allowed to post a deleted object back to the API. Earlier, this would give an error. Now, the object is reactivated and updated with the values given.
