

# Wallmob POS Release Notes

---

## Version 2.29

### Written by

Bjørn Willoch Bjanger, Product owner

### Contents in release

#### 2.29

This version has many exciting features and improvements! Wallmob now supports Adyen terminals, a robust, fast and reasonable card payment provider using Verifone terminals over Wifi.

The nasty bug that could lead to orders and EODs not being saved after an upgrade, if the app was not restarted, has finally been found and fixed. There was also a bug reported in POS 2.28 where parked bills could disappear, this has been fixed.

Preorder inbox and preorder handling has gotten a full makeover, including improved separation from shared bills and better handling of non-food orders (click and collect from webshops).

In campaigns where a free product was given away, the default is now that the cheapest item is given. You can select in backoffice to give away the most expensive.

If a product in the bill is on one or more campaigns, information about “Possible savings” are displayed to the operator, or the customer in self checkout, promoting sales of campaign products.

You can now set a timer that will log out the cashier after X minutes of no activity.

New drivers for Nets terminals and Socket scanners have been added to this version.

Various other improvements and bug fixes have been addressed.

### **API version needed for this version**

This POS version requires API version 2.20.3.0
