

Wallmob POS Release Notes

Version 3.3

Written by

Bjørn Willoch Bjanger, Product owner

Contents in release

3.3

This version releases the contents of sprint 33 and 34. The version was approved in App Store Tuesday February 16.

We have improved handling of Verifone terminals as some scenarios with bad network caused negative effects.

MobilePay implementation has been updated to v10 of the MobilePay API, this means that new setup values must be entered for those using MobilePay.

You can register orders for a customer into another shop using our preorder mechanism. Stock for the selected products in that shop is shown.

You can now enter the giftcard reference in POS and search for the giftcard when the QR code is not possible to scan.

Support for weight codes in Swiss format has been added.

More Epson printers are now added from discovery. Receipt printing logic has also been rewritten to utilise the paper width better and give clearer, more readable receipts.

We have added a certificate in POS to protect against man in the middle attacks where other servers can reply to requests to the Wallmob server.

In self checkout mode, printing a receipt is now enforced also for card and Vipps payment, for the customer to be able to verify that his items have been paid.

We now launch full support for setting up loyalty points to earn from products, and using your loyalty points as payment in later sales. The available points for a customer is shown when a customer is selected.

Many improvements and reinforcements have been added.

API version needed for this version

This POS version requires API version 2.21.1.0
