# Extenda GO POS Release Notes

---

## Version 3.4

### Written by

Bjørn Willoch Bjanger, Product owner

### Contents in release

#### 3.4

This version releases the contents of sprint 35 and 36. The version was approved in App Store Thursday April 8th.

We have now rebranded Wallmob POS to Extenda GO POS, and changed icon, graphics and translations to reflect this. The ID of the app is still the same, so all existing Wallmob users will just get an upgrade and see the new icon and app name in the same place on their home screen.

In addition, lots of new goodies are offered.

We now support Nets Connect @ Cloud terminals, which give way better stability than over Bluetooth, and a wider selection of terminals. You can now use ISMP4, IPP 350, Move and Lane terminals

We have fixed a bug in the handling of Verifone terminals as some scenarios when going to background caused POS to disconnect.

You can now do return from an order directly from the orders list in POS backoffice, a new return button is added on each row.

On shared bills, you now get a traffic light indication to show if everything is ready, some dishes are ready, or nothing is ready yet.

You can now also drag and drop shared bills onto each other to merge them if tables are combined as you serve your guests, to simplify payment!

We have added a printer status icon in the navigation bar to show if the printer is connected. It is now also only possible to select one printer for receipt printing. This is done in preparation for implementing a print queue to ensure everything that should be printed is printed. If one printer is offline and another printer prints, this would cause unclear situations in the printer queue handling. If more than one printer is needed, KDS should be considered as the preferred solution for order handling.

POS now remembers the selected terminal and printer also after logging out of master user.

Campaign logic has been rewritten so you can select in backoffice if you want to qualify in complete multiples when you have more than one qualification set in a campaign(Promotion).

CCV terminal receipt handling and logging has been improved after certification with CCV.

If you are using Dintero payment, but you are not using Dintero loyalty, we can now set a parameter for the master user to block looking up discounts before payment. Contact support for this.

User images were not scaled correctly, this has now been fixed.

The handling of inactive products and empty folders in layout templates for product buttons has been improved.

Many other improvements and reinforcements have been added.

## **API version needed for this version**

This POS version requires API version 2.21.2.0
